

What went live in today's release — new capabilities and the safety fixes behind them.

NEW FEATURES

- FYERS is live** — Out of beta — full live trading, protected exactly like Dhan and Zerodha (entry first, stop/target placed only once the entry fills, verified and auto-restored). Scheduled algos can run on FYERS too.
- MTF (margin funding)** — New Product option — CNC (delivery) or MTF — on Zerodha and Dhan. MTF positions get the same overnight-persistent protection, targets, split T1/T2 and EMA trailing as CNC.
- EMA Crossover filter** — New entry filter: pick stocks where a fast EMA crossed above a slow EMA within the last N trading days. A daily (end-of-day) signal, judged on closing values only.
- T1 / T2 with EMA Trailing** — You can now set profit targets AND trail together. T1/T2 stay real broker orders; once price reaches your R:R target, EMA trailing keeps lifting the stop (it never moves down).

FIXES & SAFETY

- Saved screeners fixed** — Re-saved screeners with dated rules (e.g. "Turnaround") were returning "No stocks found" in the app while the website showed results. Rolling dates now resolve correctly.
- MTF double-stop guard** — A first MTF trade could end up with two protective stops on one position. Fixed — MTF now routes to persistent protection, and the stop-restore pass can no longer arm a duplicate.
- Trailing accuracy** — The EMA trail now arms at your R:R target and, after T1 books, correctly trails the remaining runner (a stale "failed" status is gone).
- Order Log usability** — The table header now stays pinned while you scroll, and the left-right scrollbar is always reachable.
- FYERS Settings cleanup** — The FYERS connect card sits with the broker selector, and the broker panel no longer shows a stale note or another broker's saved credentials.

BEFORE YOU SCALE UP FYERS

FYERS live placement is brand new. Make your first FYERS trade a small one (1 share) and confirm the Order Log shows **ENTRY + GTT OCO** before trading full size.

SAFE BY DESIGN

No change to how existing CNC/Dhan/Zerodha algos behave. The two intended behaviour changes are FYERS going live and the new opt-in MTF product; everything else is additive or a fix.
